“The world's first photograph—or at least the oldest surviving photo—was taken by Joseph Nicéphore Niépce in 1826 or 1827. Captured using a technique known as heliography, the shot was taken from an upstairs window at Niépce's estate in Burgundy. As heliography produces one-of-a-kind images, there are no duplicates of the piece, which is now part of the permanent collection at the University of Texas-Austin.” 18 Famous First Photographs in History: From the Oldest Photo Ever to the World’s First Instagram

“We may be used to selfies now, but it's Robert Cornelius's 1839 image that lays claim to the first self-portrait. Taken in Philadelphia, Cornelius sat for a little over one minute before covering the lens.” 18 Famous First Photographs in History: From the Oldest Photo Ever to the World’s First Instagram

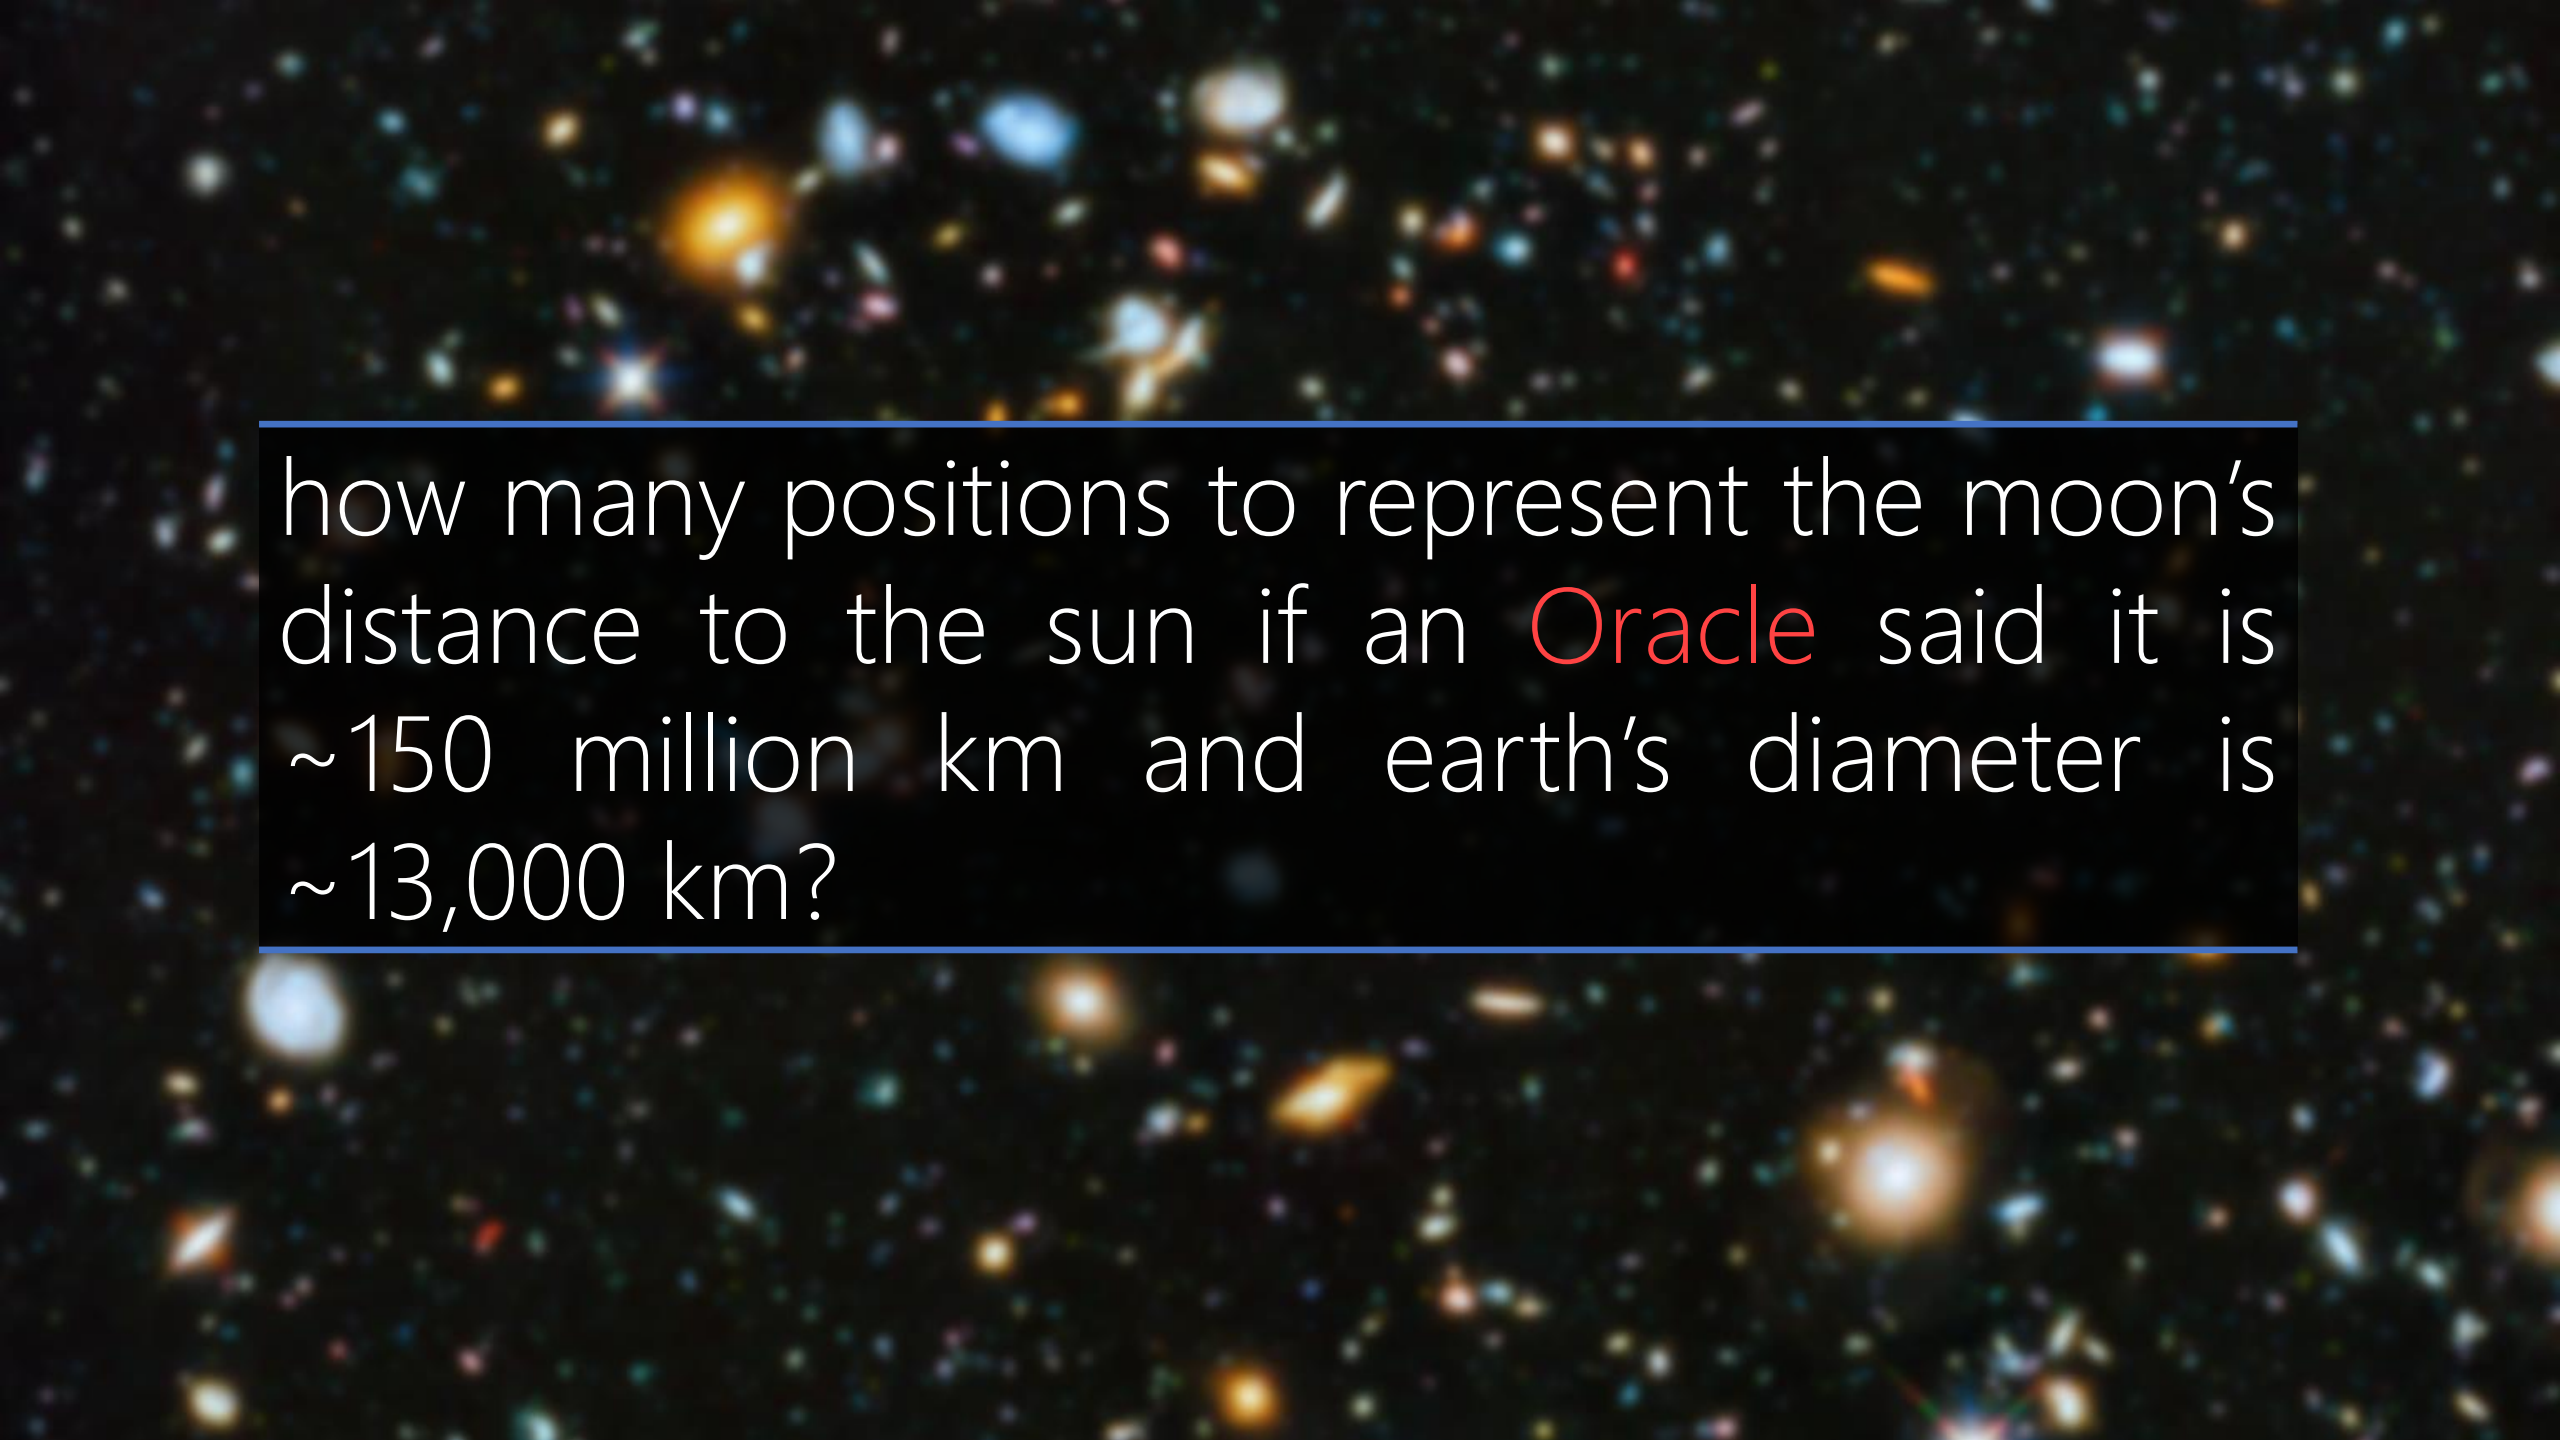
UNARY SYSTEM

aka. Base-1



how many positions to represent the moon's distance to the sun if an Oracle said it is ~150 million km and earth's diameter is ~13,000 km?

~150 million km ÷ ~13,000 km = ~12,000 Earth paper = ~3,000 positions
12,000 ÷ 3,000 = 4 pages!

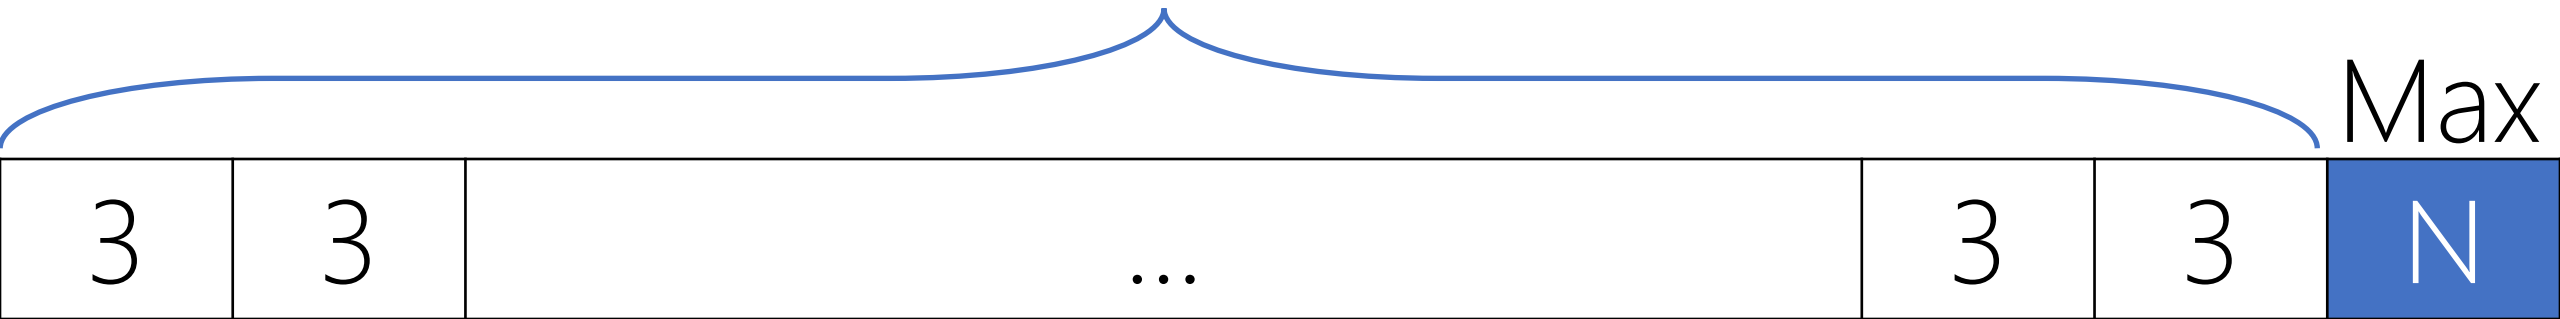
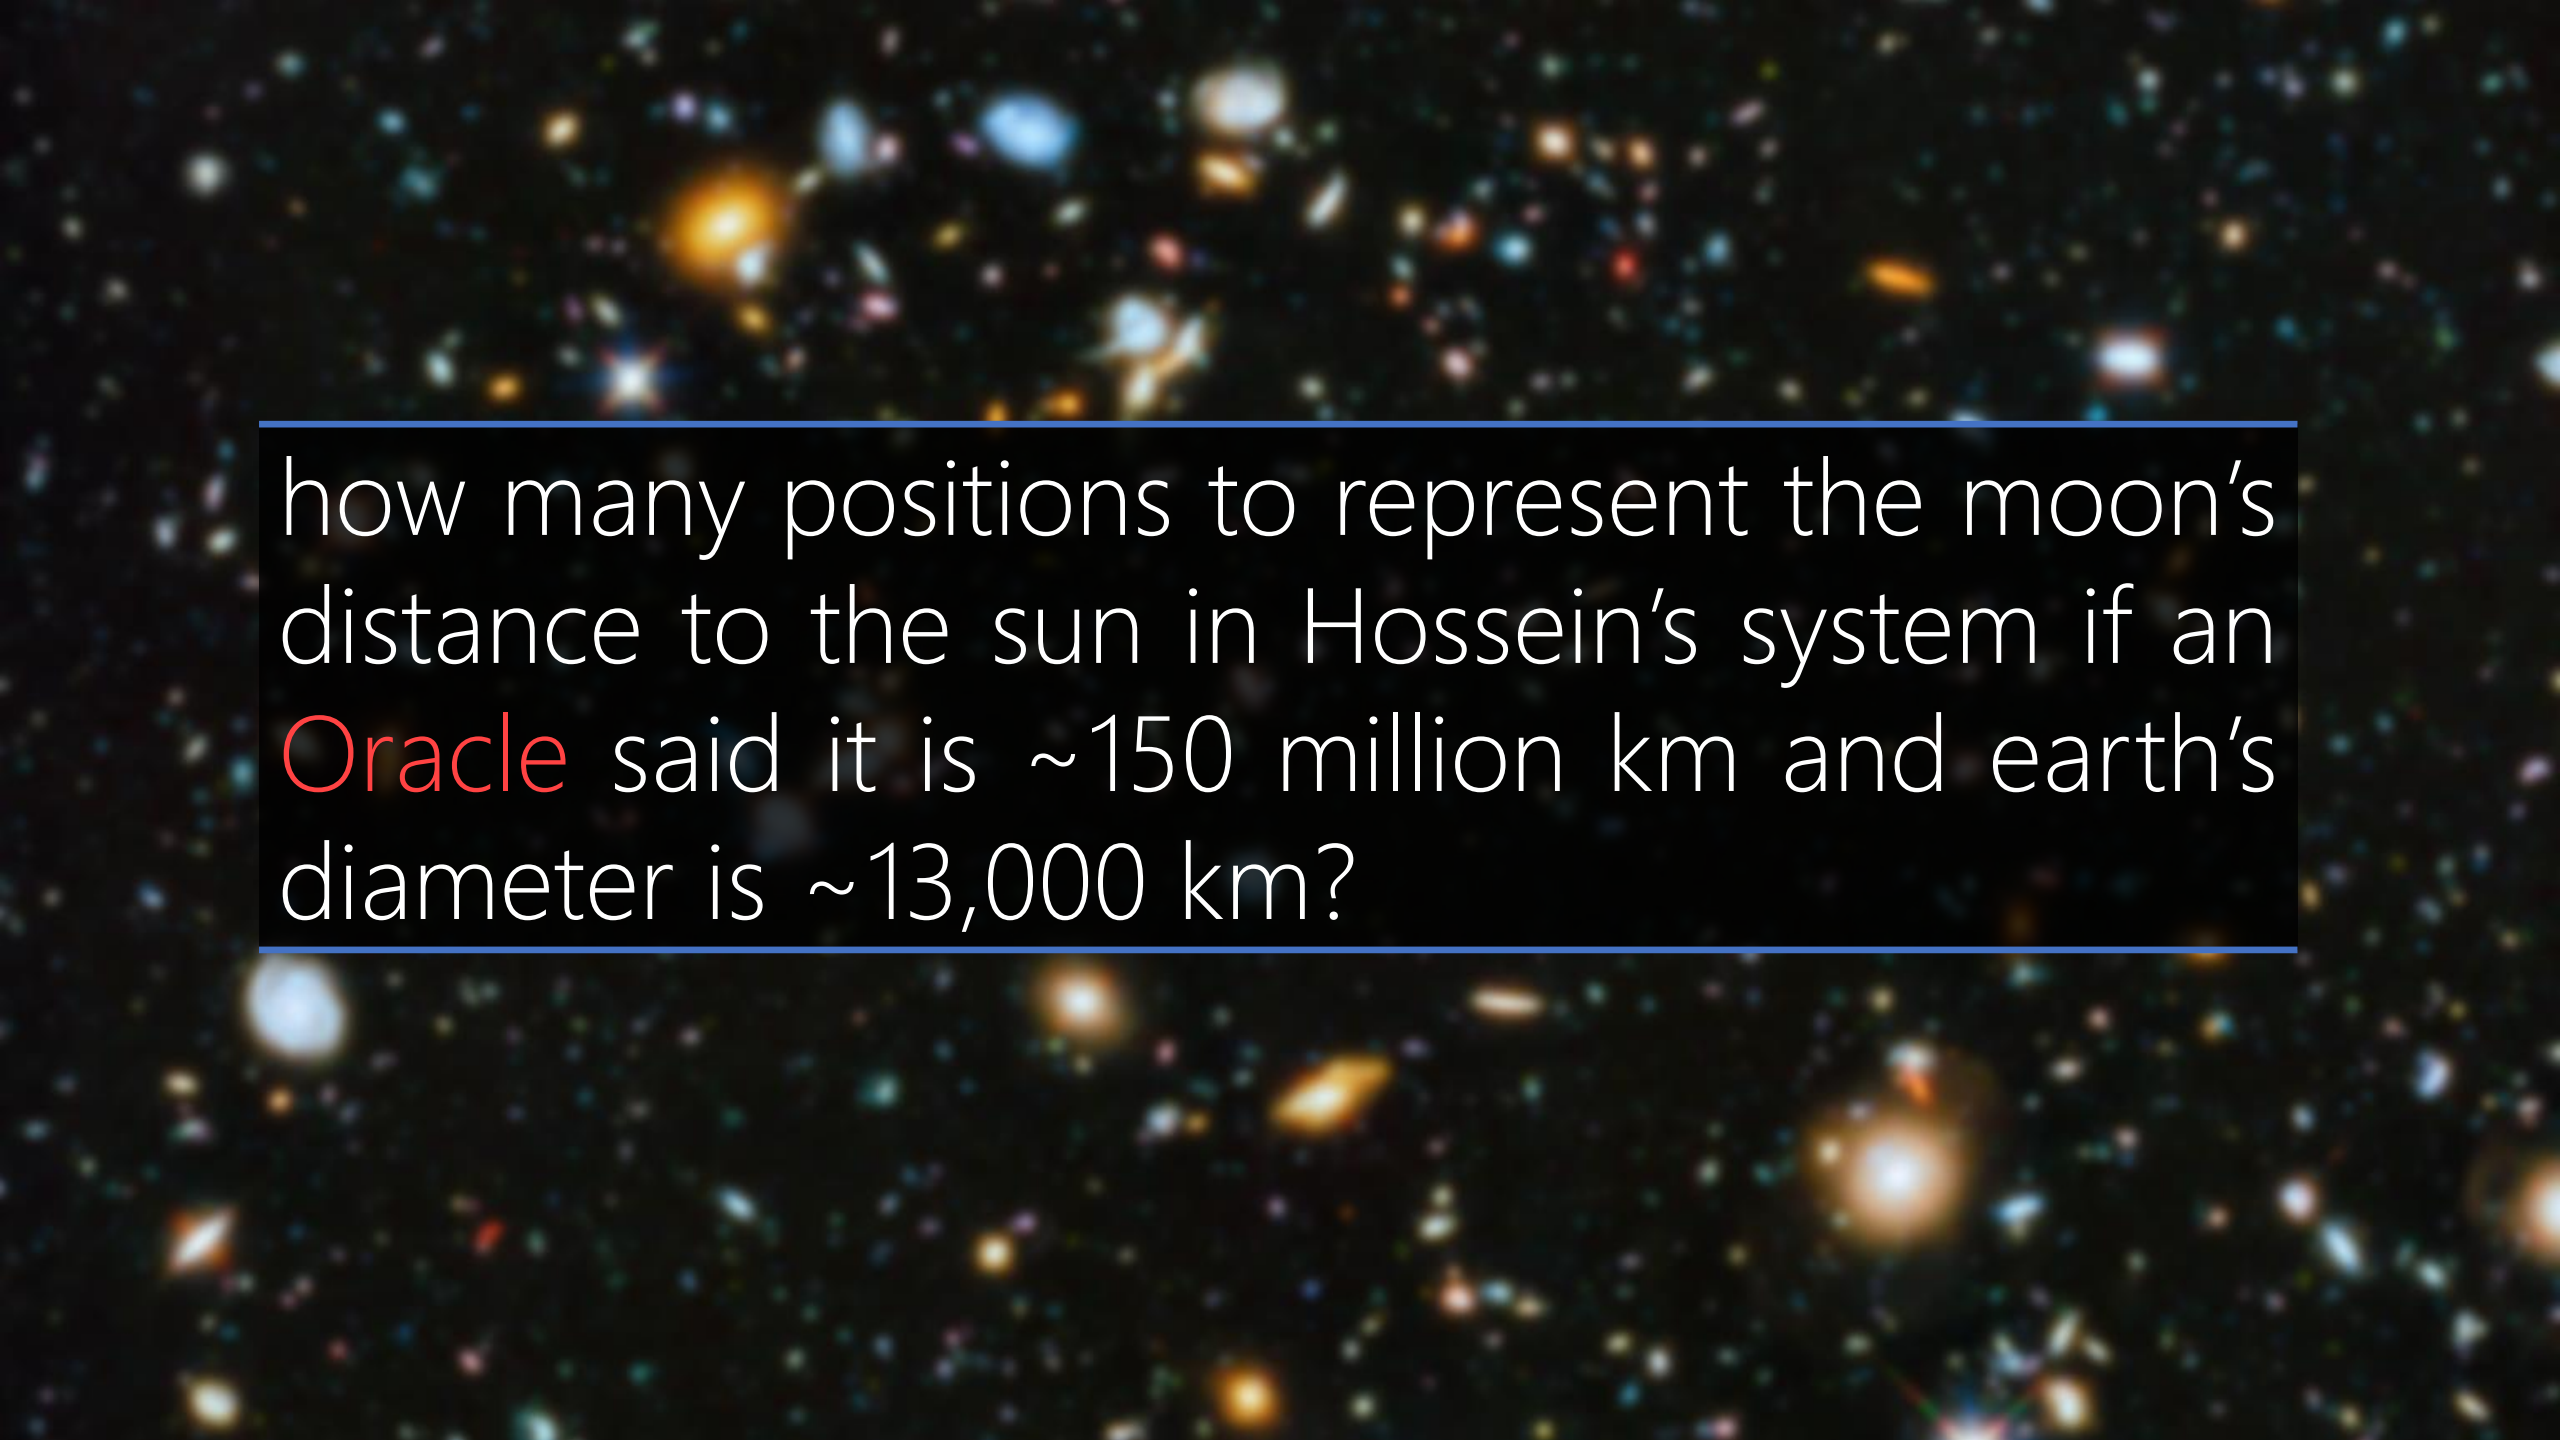
$$Max = N = 4n-1$$

$$N+1 = 4n$$

$$(N+1) \div 4 = n$$

? positions





how many positions to represent the moon's distance to the sun in Hossein's system if an Oracle said it is ~150 million km and earth's diameter is ~13,000 km?

~150 million km ÷ ~13,000 km = ~12,000 Earth

N = 12,000

n = (N+1)÷4 = (12,000+1)÷4 = ~3,000 positions

paper = ~3,000 positions

3,000 ÷ 3,000 = 1 pages

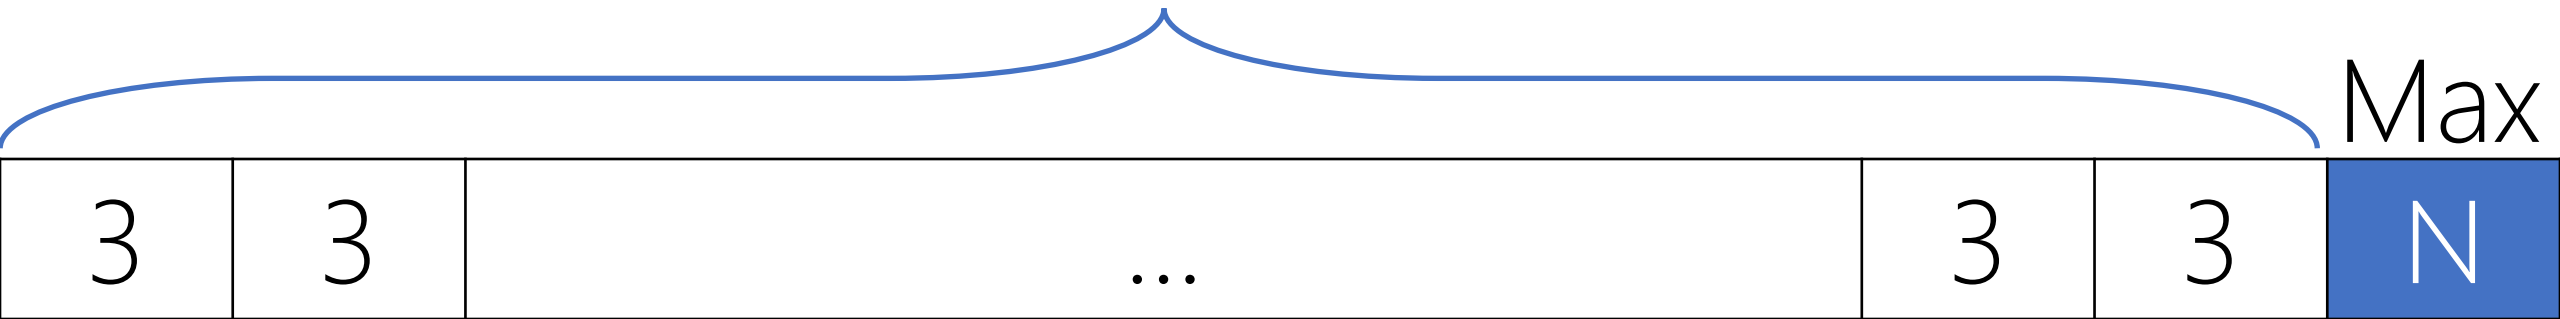
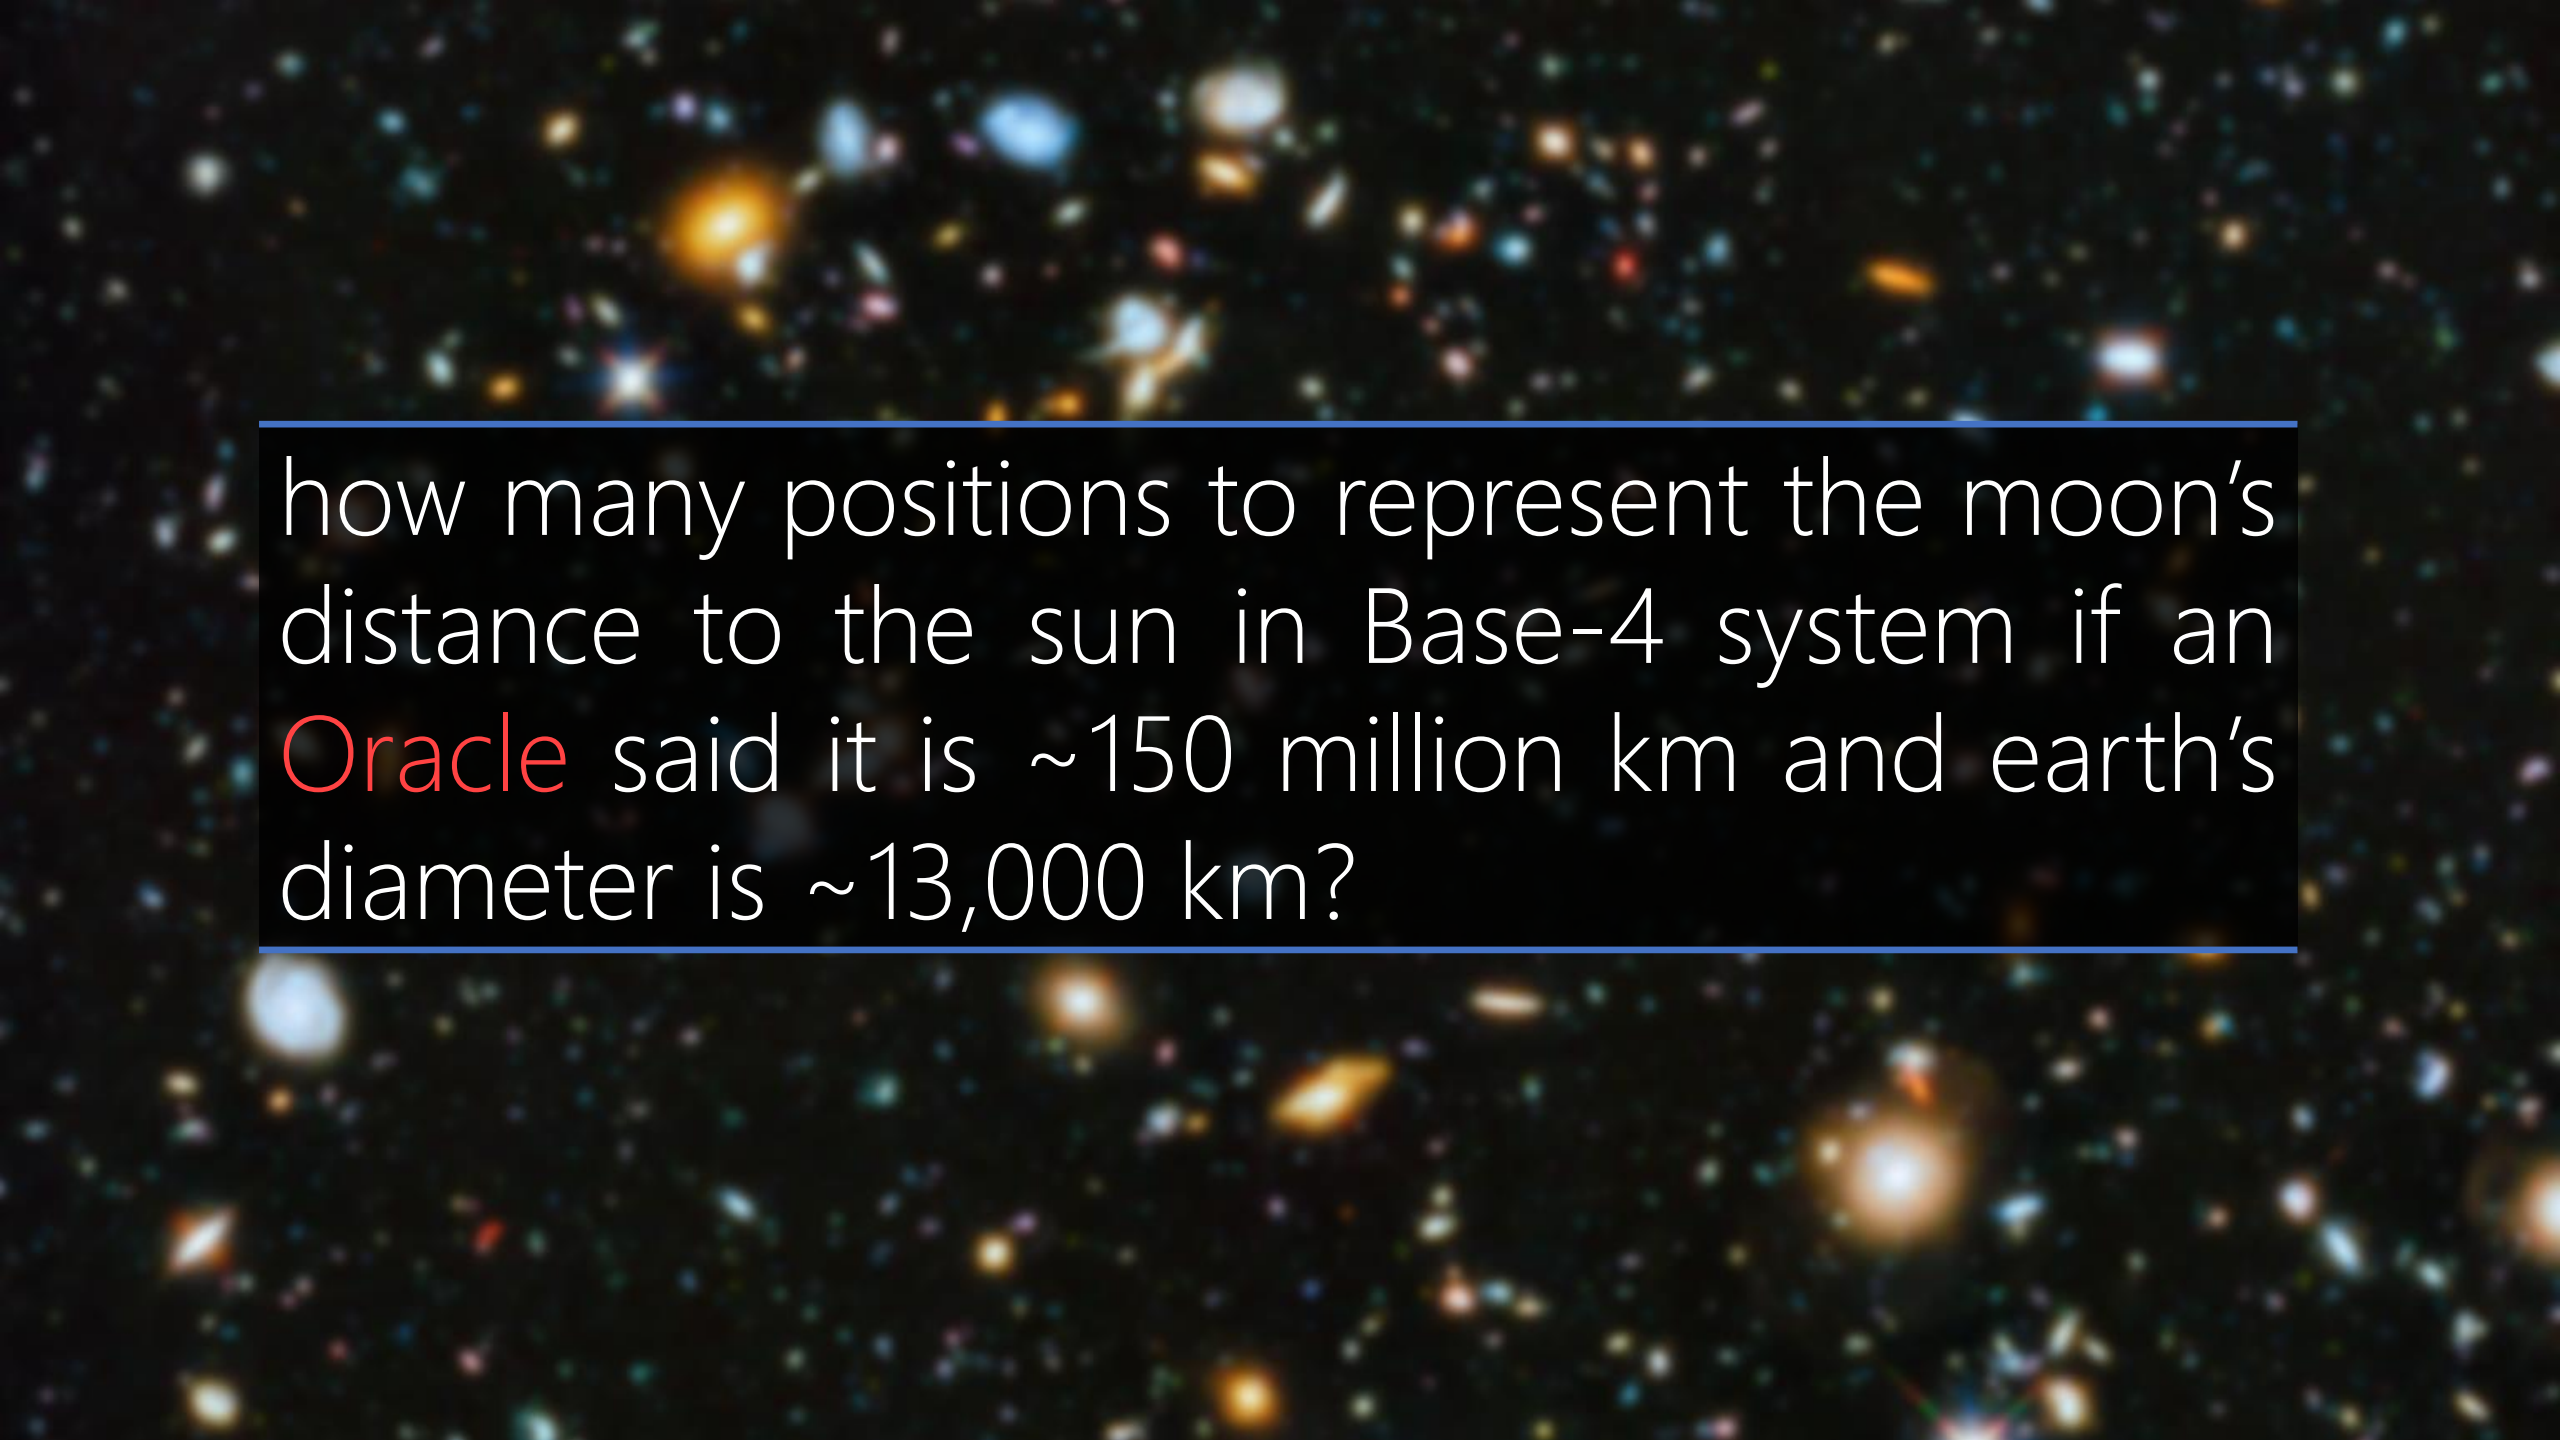
$$4^n = N + 1$$
$$\log_4 4^n = \log(N + 1)$$
$$n = \log_4(N + 1)$$

? positions





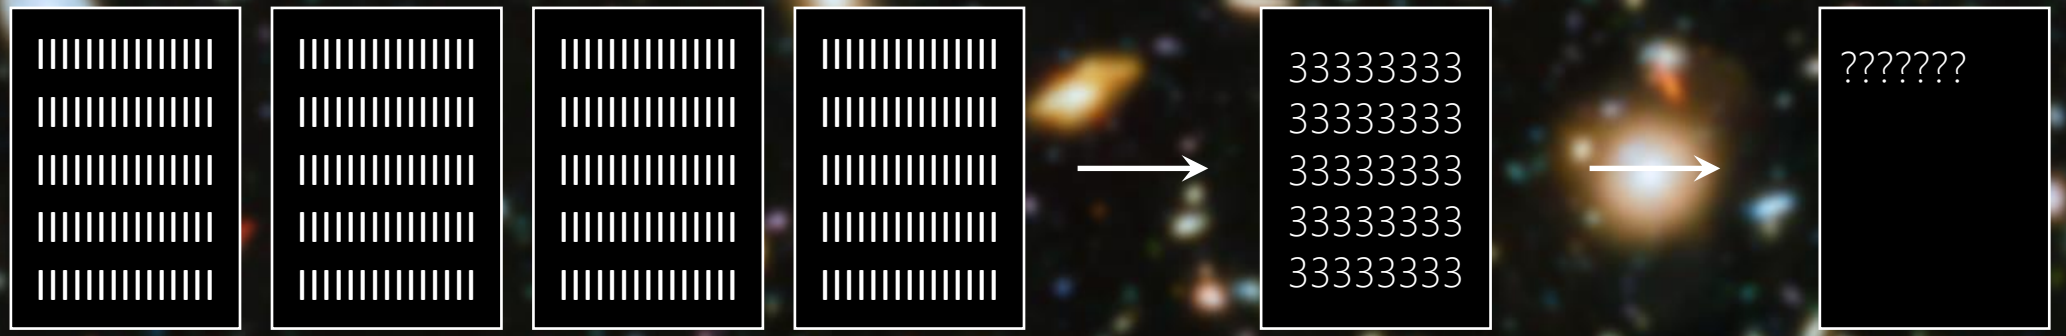
how many positions to represent the moon's distance to the sun in Base-4 system if an Oracle said it is ~150 million km and earth's diameter is ~13,000 km?

~150 million km ÷ ~13,000 km = ~12,000 Earth

N = 12,000

$n = \text{Log}_4 (12{,}000+1) = \text{Log}_{10}\ 12{,}001 \div \text{Log}_{10}\ 4 = 4 \div 0.6 = 6.79$

~ 7 positions



$$N = 12{,}000 \longrightarrow (2323200)_4$$

We'll see how to convert from decimal to base-4 or any other number systems later. Stay tuned!
